

Cancer in LGBT Communities

Lesbian, gay, bisexual, and transgender (LGBT) people are at an elevated risk for many types of cancer.

- ✓ **Lung cancer:**
32.8% of LGBT adults smoke, a rate that is 68% higher than other adults,⁽¹⁾ indicating that LGBT adults are at a higher risk for smoking-related cancers, including lung cancer.
- ✓ **Anal cancer:**
Men who have sex with men (MSM) and who are living with HIV have 30 times the anal cancer incidence of the U.S. male population as a whole. Even MSM who are not living with HIV have 3.4 times the incidence compared to the overall rate for U.S. men.^(2,3)
- ✓ **Breast cancer:**
Lesbian women have higher risk factors for breast cancer including higher rates of nulliparity (never having given birth), alcohol and tobacco use, and obesity.⁽⁴⁾
- ✓ **Skin cancer:**
Sexual minority men have 50% higher odds of having skin cancer,⁽⁵⁾ possibly as a result of tanning indoors and outside as a way to cope with negative body images.⁽⁶⁾

Cancer prevention is hindered because LGBT people are less likely to access care and utilize preventive services.

- ✓ Lesbians initiate the HPV vaccine at less than 1/3 the rate of heterosexual women.⁽⁷⁾
- ✓ Despite having higher rates of anal HPV and resulting cancers, gay and bisexual men are no more likely to be vaccinated than are heterosexual men.⁽²⁾
- ✓ 28% of transgender individuals have delayed getting care due to fear of discrimination.⁽⁹⁾

Cancer screening and early detection is increasingly effective if providers know what to screen for based on elevated risks for LGBT individuals.

- ✓ 65% of gynecologists are uncomfortable screening transgender patients.⁽¹⁰⁾ Transgender men are 11 times more likely than women to have an unsatisfactory Pap test.⁽¹¹⁾
- ✓ 86% of MSM are interested in having an anal Pap test once it is recommended.⁽¹²⁾ However, only 39% of HIV-positive, and 10% of HIV-negative MSM have received a Pap test in their lifetime.⁽¹³⁾
- ✓ Bisexual women are only 55% as likely as heterosexual women to adhere to mammography guidelines, and transgender individuals are less than half as likely.⁽¹⁴⁾
- ✓ Lesbians, bisexual women, and transgender men are 50% more likely to get routine cervical cancer screenings if they feel welcome or are out to their provider.⁽¹⁵⁾

Cancer treatment and survivorship are impacted by discrimination and stress LGBT patients experience within the healthcare system.

- ✓ LGB cancer survivors are 60% less likely than others to self-report good health.⁽¹⁶⁾
- ✓ LGB cancer survivors are twice as likely to smoke as their heterosexual counterparts.⁽¹⁷⁾
- ✓ You Can: Treat LGBT patients and their families with respect throughout the process, and ensure that patients are comfortable getting the support they need during treatment and survivorship, such as access to LGBT-welcoming support groups and therapy.
- ✓ You Can: Create a warm and welcoming environment for LGBT patients to encourage use of care and educate patients on risks so that they utilize appropriate preventive services.
